Undergraduate pursuing a degree in Artificial Intelligence and Machine Learning, seeking internship opportunities in AI research labs, tech startups, and digital innovation companies.

RAJAGIRI KAUSHIK

I am passionate about developing AI-driven solutions that solve real-world problems and improve user experiences. I enjoy working with machine learning, generative AI, and emerging technologies to transform ideas into practical applications. I am eager to continuously learn, experiment with new AI techniques, and contribute to innovative projects while growing as an AI Developer.

EDUCATIONAL BACKGROUND

Pursuing Bachelor's Degree in Artificial Intelligence and Machine Learning — Aurora's Degree College (started 2025, expected to complete 2028)

Intermediate — Vasundhara Degree and PG College (2023 – 2025)

SKILLS AND PROFICIENCIES

- GenAI, LLMs, Deployment & Tools.
- Problem-solving skills and willingness to learn
- Interpersonal communication skills

PROJECTS

1. Code Assistant – Hybrid RAG

Code Assistant is a Retrieval-Augmented Generation (RAG) application for asking questions about an indexed codebase or document collection. It combines dense vector search, sparse keyword search, cross-encoder reranking, and an LLM-generated answer with optional source snippets.

<https://github.com/krk-90/Simple-chatbot-Q-A>

2. Network Debugger Agent

AI-powered network debugging agent that combines live diagnostics (ping, traceroute, DNS, TCP/TLS checks) with RAG over incident history, runbooks, and architecture docs to autonomously triage and diagnose connectivity issues.

<https://github.com/krk-90/Network-Debugger-Agent-powered-by-agentic-RAG>

3. plant_disease_prediction

A FastAPI service using a fine-tuned ResNet18 (PyTorch) model to classify plant leaf images into six disease categories — Canker, Greening, Gummosis, Healthy, Leaf-miner, and Lemon-butterfly. Includes a /predict endpoint with confidence scores, aimed at helping farmers catch crop disease early.

https://github.com/krk-90/plant_disease_prediction

4. Diabetes-predictor

Predicts diabetes likelihood using a Gradient Boosting Classifier trained on health features like age, BMI, and blood glucose levels. Classifies patients as diabetic or non-diabetic to support early screening.

<https://github.com/krk-90/Diabetes-predictor>

5. Personal Assistant (in progress)

AI-powered developer productivity assistant designed to streamline software development workflows. It helps developers write, review, debug, document, and manage code efficiently while reducing repetitive tasks.
